As more and more educational institutions gain connections to the Internet and began exploring the vast resources available from many locations around the world, the non-graphical limitations of the DOS environment become rapidly apparent. As the world moves into the visual world of the WWW, the need for client software that will allow the local user to access the enormous wealth of files available becomes critical.

This tutorial will focus on three Windows environment Web browsers: NCSA MOSAIC, WinWeb, and NETSCAPE. The advantages and disadvantages of each will be discussed. Tips for the installation of each in both a stand-alone and Novell network environment will be provided. An on-line demonstration of each is planned, provided there are no "net" problems.
